In this paper we examine a wide range of employee voice mechanisms from a total of 18 case studies from the UK and Republic of Ireland. We examine how voice is defined by managers and how they link voice with improved economic efficiency. The evidence suggests that employee voice is more extensive in terms of its ‘scope’ and ‘impact’ than a decade ago, although the ‘level’ at which employees have a say remains the preserve of managerial control. The evidence also suggests that the link between voice and organisational performance is problematic. The conclusion argues that organisations now face a diffuse and persistent range of concerns from highly articulate employees. In this respect, managing employee voice will be closely related to managing diversity.

Available to be cited as:
INTRODUCTION

The last decade has seen a growing interest in the notion of employee voice, both from those seeking higher levels of organisational performance and from those desiring better systems of employee representation. The European Directive on Employee Information and Consultation is also likely to strengthen the notion of employee voice. In Ireland there has been a strong centralised corporatist model of participation and partnership among the social partners (government, unions and employers), while the UK has pursued a more decentralised bargaining and consultative trajectory. At the same time, both have a long history of voluntarist industrial relations and are the only two EU member states that do not have a general statutory framework to ensure employee involvement. This will change with the transposition of the EU Directive into domestic legislation by 2005 or 2008, depending on the size of the undertaking (Hall et al. 2002).

Until 1979, the pattern of employee voice in both Ireland and the UK followed broadly similar pluralist-union centred trajectories. In the UK more direct and individualistic forms of voice took precedence following the Thatcher assault on trade unions. In Ireland collective bargaining, worker directors on the board of semi-state industries and joint consultation have remained much more prominent. The collective spirit of employee representation in Ireland has even been associated with the phenomenal rates of economic growth (Sabel, 1996; McCartney & Teague, 1998; Gunnigle, 2001). In the UK also, several studies appear to indicate a positive relationship between voice and organisational performance (Patterson et al. 1997; Sako, 1998; Gollan, 2001; Guest & Peccei, 2001).

However the relationship between participation and performance has not gone unchallenged. In Ireland, Roche and Geary (2002) question the extent to which new forms of collaborative production have taken hold and D’Art and Turner (2002) demonstrate a strong ‘them and us’ divide between management and workers, despite the institutional support for
employee participation. Similarly, drawing on the Workplace Employee Relations Survey (WERS) series in the UK, Millward et al. (2000: 137) note that perceptions of ‘fair and independent voice’ seem to be related to the presence of a recognised trade union and union representation on a formal joint consultative committee.

In this article based on case studies in the UK and Ireland we suggest that employee voice is more extensive in terms of its scope and impact than a decade ago, although the level at which employees have a say remains the preserve of managerial control. However, we also express caution in terms of directly linking voice with sustained organisational performance.

**FRAMEWORK AND RESEARCH METHODS**

‘Voice’ is a word that has been more widely used in the practitioner and academic literature on human resources management (HRM) and industrial relations in recent years (Beardwell 1998; Sako 1998; Roche, 2000; Benson 2000). In the ‘best practice’ HRM and high performance literature, voice is seen as a key ingredient in the creation of organisational commitment (Lewin & Mitchell, 1992; Pfeffer, 1998). Indeed, publications on participation emphasise the importance of giving employees a feeling that they are making choices, in both union and non-union settings (Walton 1985; Dundon, 2002; Ackers et al. 2004). Conversely, the alternative strand sees voice in terms of rights, linking this to notions of industrial citizenship — a concept given greater impetus through membership of the European Union.

The academic concept of ‘voice’ was popularised by Freeman and Medoff (1984) who argued that it made good sense for both company and workforce to have a ‘voice’ mechanism. This had both a consensual and a conflictual image: on the one hand, participation could lead to a beneficial impact on quality and productivity; while on the other it could deflect problems which otherwise might ‘explode’. Trade unions were seen as the best agents to provide voice as they were independent and would reduce exit.

Given that the subject of voice has attracted interest from a variety of perspectives and
disciplines, it is hardly surprising that its meaning has also been interpreted differently by scholars as well as practitioners (Marchington et al. 2001). A framework for employee voice can be seen in Figure 1 with voice differentiated along two dimensions. These are (i) direct (based on employees themselves) and indirect (based on a union or collective grouping), and (ii) shared and contested agendas. This provides four ideal types: upward problem-solving, grievance processes, partnerships and collective bargaining. Of course these are not bald alternatives as organisations can operate on more than one of these dimensions. These two axes are meant to imply tendencies towards, for instance, a shared agenda or contested agenda, rather than absolute differences. Our framework for voice is therefore rather broader and more systematic than those used by most commentators.

**FIGURE 1 HERE**

The research was conducted between March and June 2001 in a total of 18 organisations. The general approach was a qualitative given the nature of both the information sought and the ‘exploratory’ character of the research. There was no pre-determined definition of employee voice and one of the key objectives was to explore managerial conceptions of employee voice, choice and impact on performance. The major limitation of the research is that interviews were conducted just with managerial respondents. These included the person responsible for HR and other senior managers, such as the chief executive, managing director or senior site manager. In addition to this however, access to documentary material (such as employee attitude surveys, mission statements, corporate information and personnel policies) was made available in several organisations.

Although this particular study was exploratory and limited to managerial respondents, it is worth noting that we have had contact with all but four of these organisations through other projects over a sustained period of time. Seven of the cases formed part of our 1992 study for the U.K. Employment Department. A further seven have been the subject of other research,
either during the last decade or in parallel with other studies, for example, for the UMIST Future of Work project and research funded by the European Regional Development Fund. This provided a degree of knowledge about the organisational context prior to the fieldwork, as well as an understanding of the major employment relations issues at these sites from several respondents, such as shop stewards and employees. Consequently, data collection involved more than a single snapshot visit.

In order to obtain as rounded a picture as possible of employee voice and management choice, the organisations reflect differences in size (medium and large), structure (single/multi-site), representative systems (union and non-union) as well as covering a range of sectors of economic activity. These broad contextual factors have been shown to be important discriminators in other research evidence (see Cully et al. 1999). Seven of the companies had a partnership agreement with the recognised trade union, two had embarked upon union de-recognition and three employed specific non-union employee consultative committees. Five of the organisations reflected stand-alone, small-to-medium sized enterprises while 13 had operations at more than one site. Another five were classified as multinational with locations in different countries and continents (see Table 2).

**DEFINING VOICE**

Although some respondents felt that previously they had never heard of the term ‘employee voice’, most were able to provide a definition to illustrate their understanding of what it meant. A number of respondents felt that it had resonance for them, and they were comfortable with its usage. Principally, most of the managers tended to see voice as synonymous with terms such as ‘consultation’, ‘communication’ and ‘say’. There were five broad ways in which the managers spoke about employee voice in general. The responses were analysed after the interviews had been completed and then grouped into categories using the definitions outlined below.
changing patterns of employee voice, journal of industrial relations, vol 46 (3): 298-323

• communication/exchange of views: an opportunity for employees and managers to exchange views about issues, generally on an individual basis but also through a collective consultation process.

• upward problem-solving: an opportunity for employees to provide feedback on specific topics, not so much as a dialogue but more as a way of providing ideas to improve organisational performance.

• collective representation: an opportunity for employee representatives – union or non-union – to communicate the views of the workforce to managers either through partnership or collective bargaining.

• engagement: a feeling on the part of staff that they are able to express their views to managers in an open environment and that management will provide support to allow this to happen.

• say about issues: the opportunity not just to have a ‘voice’ on issues but an expectation that these views will be taken into account and may lead to changes in how decisions are made.

It will be apparent that the first three categories are concerned with processes, the fourth with feelings and perceptions and the final category with outcomes. It is therefore quite feasible that a respondent could speak in terms of more than one category during the interviews. Interestingly, not one respondent mentioned ‘grievances’ as a form of employee voice in their initial definitions. Moreover, even when the issue of ‘grievances’ was discussed later in the interview, this tended to be viewed by most respondents as a procedural activity that had little to do with their understanding of the term. At most, it was considered marginal to the notion of voice.

Voice as communication was by far the most common immediate response to the question asking managers to explain their understanding of the term ‘voice’. The Operations Manager
at Bet.com summed up the ideas of many when he said: ‘we understand this to mean any form of two-way communication, particularly on an individual basis’. This perspective, that voice is more than one-way downward communication, was echoed by the HR Manager at Eiretel who suggested that:

voice is about corporate communications and the strategy is designed in such a way that all employees can represent their views to management, rather than it just being the other way around. Our aim has been to break down the barriers.

These are clear expressions of managers seeing voice in terms of information exchange and discussion with individual employees rather than through any collective mechanism. It was also apparent from these definitions that employee voice was seen largely in terms of its contribution to improvements in organisational performance. At Airflight, for example, it was conceived in terms of employees adding value and enhancing their contribution to organisational goals. Voice was not seen as an opportunity for employees to express dissatisfaction with their working environment or their supervisor’s style of management.

It was rare for these respondents to conceive of information exchange through the lens of collectivism, although it was readily apparent from the mechanisms they described in the interviews that many collective forms of voice did exist. Interestingly, the first aspect of voice mentioned by the Managing Director of the small transport company, Easymove Transport, was his relationship with the local shop steward. He noted that ‘we have union representation on a friendly basis. We have a general dialogue, and we (the owner and the shop steward) might disappear down the pub at 5pm on a Friday and have a chat about what is going on.’ However, this is hardly the stuff of formal and constitutional industrial relations.

There also seemed to be a clear recognition that voice might be different now from what it was 10 or 20 years ago. The Personnel Manager at Southern Shoe responded to the initial question by saying:

employees don’t get much voice these days! There were times, 10 years ago, in the
factories when real efforts were made to ensure that regular communications went on with the workforce through weekly team meetings, suggestion schemes, departmental meetings and even whole factory meetings.

Another group of respondents saw voice not so much as a dialogue or two-way exchange of ideas but rather as the transmission of ideas to managers in order to improve organisational performance, in short, upward problem-solving. Employees were seen as valuable receptacles of knowledge and ideas that could only help to improve performance, and as such were important sources of expertise, as argued by the Managing Director of Leisure Co:

the term has a resonance with me. I started off in the ranks myself and have always been very keen that employees have a view. After all, they are actually face-to-face with customers, not the Managing Director, so I rely very much on what they are able to filter up.

Notions of collective representation were not central to the initial definitions of voice. Yet when we asked for specific examples, it was noticeable that a wide range of collective voice mechanisms are in use. One of the large financial services organisations, Retail Bank, used the term ‘partnership’ in referring both to employees’ financial stakes in the company as well as to its more contemporary usage in employee relations. The HR Manager said that ‘the union is talking about partnership because the government is seen to be promoting employer–trade union partnerships’. The HR Manager at Whisky Co also felt that ‘employee voice’ equated with partnership:

I would say that it’s partnership in its most adult and consensual form. It’s partnership because we want to be with each other and because we recognise the advantages of working constructively with the trade union. The more free-flowing the information in the dialogue, the less there are any surprises and so it’s a lot less adversarial.

The most radical and philosophical interpretation of voice came from the Labour Chair of Governors in City School who stressed that ‘a collective union voice is a must for our
Changing patterns of employee voice, *Journal of Industrial Relations, Vol 46 (3): 298-323*

Evolution. Each person should have a voice and it does help if the people are organised.’ It is also important to note here that collective voice was not just restricted to unionised establishments, but apparent at a number of organisations that operated with staff associations (such as Housing Association) or non-union consultative forums (as at Scotoil and Compucom).

There are structural and psychological aspects to voice, in much the same way that empowerment is seen to constitute both of these (Wilkinson, 2002). The structural aspects can be observed from an examination of systems and practices that operate in an organisation, but this does not ensure that employees either feel that they have a voice or are confident in utilising this voice. Managers at two organisations made specific reference to this aspect of voice. The Chief Executive of Aqua spoke at length about the need for voice to be real and not merely symbolic. He said:

> employee relations is rather like customer relations. It’s a bit like treating people in the way that you would like to be treated. This needs to be genuine engagement rather than just tokenism. If you can capture the hearts and minds of people in the business, then very high levels of energy are released. If we think that we can manage organisations in a hierarchical way, we are in for a big shock.

While many of the respondents talked in general terms about the *processes* of voice, quite a number also insisted that the *outcomes* of voice were particularly important. The words used varied between ‘influence’ and ‘say’, but broadly they coalesced around the notion of employees having some say or influence over policies and practices. We are not seeking to convey the impression that this represents a situation in which changes are led by employees or that their voice is actually ‘heard’ by managers while making decisions. Nevertheless, the distinctive feature of these definitions was that they all related to the potential for employee voice to impact upon outcomes rather than just describing the processes that are used in organisations. Many of the managers stressed the importance of informal mechanisms and

processes here, rather than just the formal structures that are provided in organisations.

Both the General Manager and the HR Specialist at ConsultancyCo felt that voice was meaningless unless it made an impact. The General Manager suggested that: 'Voice is about having opinions and observations heard. How voice is realised, recognised and acted upon is what matters. There is no “real” voice if it is not listened to.'

**Different forms of employee voice**

Given that seven of the case studies took part in a similar project 10 years ago, there was an opportunity to examine the changing patterns of voice over time. Two findings stood out from this analysis. First, some of the different employee involvement mechanisms found in 1992 had now been recast or fused into more all-embracing upward problem-solving voice mechanisms. There was evidence of fewer ad hoc choices and that schemes had been more clearly integrated, particularly in terms of employees ‘having a say’. The second is representative participation. In many cases this was through union representation and collective bargaining, although systems for employee representation in non-union firms, or even the co-existence of union and non-union channels at the same workplace, existed across the case studies. Significantly, the role of trade unions in relation to direct involvement had changed markedly with the two channels more closely engaged. There was some evidence of derecognition as well as new union recognition agreements, although overall senior managers saw value in working with trade unions and appeared to share information with union representatives at earlier stages in the process.

Table 1 provides data on ‘employee voice’ for the 18 organisations included in the study. As well as categorising the forms of employee voice into the two broad categories identified above, the final column also provides an assessment of the most distinctive practices. It is apparent from Table 1 that upward problem-solving is reported as more extensive than representative participation — as we might have expected from other recent studies (Cully

et al. 1998; Gill & Krieger, 1999).

TABLE 1 HERE

UPWARD PROBLEM-SOLVING IN PRACTICE

All the organisations employed downward communications in one form or another, with about one-third making use of electronic media to increase the ease by which employees could respond to management or convey their own opinions to senior managers. Not surprisingly, this was more common in the service sector where white-collar workers (and particularly professionals) formed the bulk of staff. At Eiretel, for example, the US Vice President would often send electronic messages to all staff, a practice that has been copied by other senior managers. The system is used to allow staff to post questions about technical or human resource issues direct to senior managers. While in theory these have to be answered, there was some scepticism about the degree to which the whole process was stage-managed.

Two-way communications are a major form of voice at all the sites. Most of these are relatively standard in format, but it is worth providing a few examples to show how these operate in practice. At the school, there are daily ten-minute meetings before teaching commences to allow the Head to brief staff on important issues for the day, such as absenteeism and staff cover, important visitors and new information of relevance to the school. A quite different type of arrangement operates at the transport firm. Here, the Managing Director arranges a meeting every few months on a Sunday morning in a local pub. All drivers are invited, and although they are not paid to attend, the company provides bacon sandwiches and a beer kitty. Middle managers are barred from these meetings, which are attended by the Finance Director and the MD. The Managing Director felt that this represented the best way for him to get information across to staff as well as keep in touch with employee opinion.
The use of employee attitude surveys were used in about half the organisations studied. Some of these operate at the sites we investigated as part of world-wide benchmarking exercises for the companies as a whole, with the results then being fed from corporate headquarters back down the management chain to staff on the shop floor or in the office. In these circumstances, it is unlikely that employees (or managers for that matter) feel any ownership of the results, other than as a benchmarking tool through which to secure improvements in performance.

The vast majority of the case studies reported the use of project teams in some form or another. Some of these are central to the operation of the organisation, such as the matrix teams at Compucom and ConsultancyCo that are formed to deal with specific projects and are then disbanded once the job is completed.

**REPRESENTATIVE PARTICIPATION IN PRACTICE**

About two-thirds of the organisations had some form of joint consultation operating either at site level or beyond the workplace, compared with about one-quarter for the WERS 1998 sample. Joint consultative committees (JCCs) were more common in larger, multi-site workplaces, and about half the unionised workplaces had JCCs compared with all but one of the non-union firms. At some companies, these had been in existence for a long time, and they followed the fairly standard pattern of regular monthly or quarterly meetings between a number of senior managers and the shop stewards. The activity levels of these meetings varied. At Scotchem shop floor meetings with union representatives tended to focus on trivial matters such as ‘showers, lockers and overtime levels’. Yet they also acted as a ‘safety valve’ and were supplemented with additional meetings, incorporating all the unions. These appeared to be more strategic in nature and formed part of the partnership agenda at the plant, as the Manufacturing Director at Scotchem explained:

This is an opportunity to share the slightly longer-term outlook with these guys following
the senior management meeting. I talk with them about the manufacturing plan for the
next month and what the issues are. It gives the senior stewards a chance to express one
or two of their concerns about the future.

Several organisations specifically set up non-union channels alongside the union framework
or include non-union representatives at the same meeting. At Midbank, for example, despite a
range of mechanisms to consult with unions – such as the Joint Partnership Meeting – a Staff
Council had been established with representatives elected by all staff, whether union or non-
union: ‘The staff council is a consultation forum. It’s just giving them information, it’s not a
negotiating forum or anything’.

Significantly, the coexistence of union and non-union forms of employee voice was more
than an isolated example. Indeed, joint consultation – in one form or another – was widespread
at organisations that did not recognise unions for collective bargaining purposes. At Housing
Association, a JCC was set up over 20 years ago. The Deputy Director regarded it as:

A mechanism that has stood the test of time, but it has not been widely used by
employees for making their voice heard. However, I can probably count out on one hand
the number of really contentious issues that have been thrashed out around the table.

Seven of the cases had some form of partnership scheme in existence, although not all
actually termed it that. Perhaps the most extensive and wide-ranging partnership agreement
was between Midbank and the trade union, UNIFI. The key principles of the agreement relate
to ‘mutuality and inclusiveness, an acceptance that both parties have distinctive but
complementary roles and an acknowledgement that difficult and contentious issues have to be
confronted jointly’.

A partnership agreement also operated at Whisky Co under the title ‘Working Together’. This
used phraseology that is well-known in these sorts of agreement — mutuality, joint
commitment to organisational performance, recognition of separate interests. A section from
the agreement noted that:
The culture (of ‘Working Together’ in partnership) promotes employee development, participation, flexibility, performance and reward within a framework of excellent communications. The agreement will be the basis of our joint ability to add value to the company’s business performance through the creation of an ethical and inclusive environment of opportunity.

European Works Councils (EWCs) are obviously a relatively new ‘voice’ structure for most workers in the UK and Ireland. The EWC at Whisky Co came about because the firm is part of a much larger European-owned multinational, at Eiretel through its part in a large American-owned firm, and those at Scotoil and Southern Shoe due to these UK-owned firms having other sites throughout the rest of Europe. Overall, however, EWCs were seen as a relatively remote mechanism for employee voice: more as something that was required rather than a mechanism that was seen to add value. Eiretel provided two employee representatives for the EWC, but again this was considered to be too ‘distant’ for it to be meaningful for employees at the Irish plant. Moreover, it was felt that the agenda was rather narrow and minimalist, in line with the perception that the company had been forced to accept an EWC rather than willingly introduce and develop this. In a similar vein, the EWC at Southern Shoe had only recently been introduced and had yet to find a clear focus.

The final form of voice that we consider is collective representation, which existed at about two-thirds of the organisations. Trade unions have always provided a channel for independent voice to employers, either through collective negotiations about wages and conditions or through the pursuit of individual employee grievances. As such, collective representation offers an alternative perspective to the forms that have been discussed so far, the vast majority of which are initiated by employers and are more susceptible to potential managerial influence and control. Additionally, while most other forms of voice that have been considered thus far are concerned with how employees can contribute – ultimately – to improved organisational performance, collective representation can provide challenges to current priorities and
perspectives as well. The impact on organisational performance may also be positive, but this can be indirect.

The form and impact of collective representation varied substantially among the organisations and this depended on, *inter alia*, the level of membership, the type of unions and managerial attitudes toward collective representation. In the case studies levels of membership varied from very high to relatively insignificant, collective bargaining took place at different levels across the larger organisations and the number of unions that were recognised varied from one to four. Significantly, while collective representation figured so little in management accounts of voice, employers still regarded unions as a positive force in expressing employee concerns and were prepared to disclose information to representatives much earlier than had been the case a few years ago.

**PERCEIVED BENEFITS OF EMPLOYEE VOICE**

Given that isolating cause and effect is problematic, one way in which voice may be seen to impact on employee behaviour and performance is the indirect linkage between practice and outcome. Although our respondents agreed that it was difficult to quantify the impact of voice, there was widespread agreement that employee voice acted as the gateway to a more open and constructive climate. It is this better climate which was then seen to help identify the links between voice and impact. Many of the managers commented that voice contributed to improved performance *because* it generated a better environment in which to work. The Chief Executive of Aqua articulated this view:

> We are spending plenty of money on [staff] engagement at the moment. We do it because we believe this adds value and what you tend to get is a slightly chaotic challenging world in which people are prepared to say what they think. I think I can prove the impact of voice. It can be seen in terms of performance and the way the business sparkles. The way that people answer letters, deal with customers over the
telephone, their feelings of ownership and pride.

This indirect relationship between voice and impact has further support in that the mechanisms used were generally part of a much broader HR agenda. Several respondents commented that in practice voice tended be one of several HR tools – including training, induction, culture change or more open management styles. For example, at Housing Association, employee voice was part of a much wider paternalistic and ethical managerial approach of ‘treating employees in a decent way’:

I don’t think we set out to say we will use employees to create a profitable or successful organisation, I think it comes from another angle … we don’t bushwhack them and catch them off guard. It’s not the kind of atmosphere we want to generate at all … If you treat your workforce decently and honestly you will reap the benefits (HR Manager, Housing Association).

When considering any specific or single rationale for why employers bother with voice, then the evidence was less clear. However, what did emerge was a combination of complementary practices and for simplicity these have been categorised under three headings. The first we have termed employee contributions. Under this, we include employee attitudes and behaviours, loyalty, commitment and co-operative relations, along with employee suggestions. The second theme relates to improvements in the way people are managed, which we have labelled improved managerial systems. This incorporates the managerial benefits from tapping into employee ideas, the informative and educational role of voice along with relations with recognised trade unions. The final theme corresponds to improved performance, as perceived by the managers interviewed. Under this heading we include productivity and individual performance, lower absenteeism and (in a few cases) new business arising from employee voice.

In reality of course, some of these areas overlap and do not represent discrete bundles but rather simplified patterns of (perceived) impact. For instance, the generation of ideas from a
suggestion scheme could shape both the nature and quality of future contributions by employees, but it may also help improve the efficiency and quality of how people are managed. Thus, in reality the precise contours and patterns are likely to be much more complicated, dynamic and uneven.

**EMPLOYEE CONTRIBUTIONS**

In two-thirds of the case studies, managers reported some improvement in employee attitudes and behaviours as a result of employee voice, albeit to varying degrees. The Customer Service Manager at Bet.com had very strong views that voice does have a positive impact on employee commitment, even though precise details were difficult to quantify:

The business won’t function properly: a) if we haven’t got people coming in who are committed; and b) more particularly, we’ve got people who were once committed but we’ve done something to hack them off. If we’re unwittingly doing something that’s not getting the best out of people then at least we have the opportunity to put things right and speak to the person.

One interesting finding from our sample related to the scope and range of issues on which employees were able to contribute. For instance, team briefings and top–down communications are often associated with more trivial matters, yet we find that voice can impact on a broader set of issues, including customer relations, organisational strategies, new services and products to clients, as well as internal work systems. At ConsultancyCo, a voice mechanism called ‘strategy days’ allowed workers to have ‘a say’ over the future direction of the company. Directors first outlined company objectives, market issues and prospective clients to the whole workforce, before employees spent the day in small groups discussing these issues and feeding back ideas to a plenary session that agreed on an ‘action plan’. At Scotchem, an employee relations workshop was one attempt to bring together union representatives and senior managers to work on issues to do with the process of managing
employment relations, including the measurement of staff satisfaction that reflected and reinforced new relationships. Similarly, at Scotoil, non-union staff representatives had a wide remit to include agenda items for discussion at the works committee. Examples ranged from proposals for new off-shore safety helicopters to improved parking facilities, free lunches, and a new company-wide discipline procedure. The rationale was explained by the Senior Site Manager at Scotoil:

Our employees spend hundreds of thousands of pounds every day to pursue business objectives. Our experience with consultation is that our employees place the same degree of objectivity and professionalism on the issues that they are asked to give their opinions on as they do for their business goals.

While any attempt to unpack voice or draw any direct causal links to enhanced performance is problematic, there does seem to be a strong pattern to suggest that the range of issues to which employees contribute are far-reaching and extensive. On the whole, our study does not support the idea that voice is confined to trivial matters in order to conjure up an illusion of pseudo-participation. The difficulty is that precise details of cause and effect are almost impossible to disentangle. In Ireland there was a greater tendency for the more significant issues – such as pay and terms and conditions - to be dealt with through a centralised partnership structure, while in the UK, locally-based systems of representation were more prominent. Yet at the same time, across both countries, the combination of direct and indirect voice mechanisms tended to complement each other rather than work in opposite directions.

**IMPROVED MANAGEMENT SYSTEMS**

In addition to improvements arising from employee contributions, there were also spin-offs that were believed to improve people management systems and processes. At Scotchem, it was felt that the greater willingness by staff to challenge issues and decisions around the site had an educative impact for management by improving HR systems. Also, at City School, an
achievement award for improved performance was won, and the Head felt that the School Development Planning Day two years ago was one of the major reasons for a change in ethos. At that event, the Head presented information on the school's results and then broke staff into groups to discuss the way forward.

This meant looking at the ethos of the school and trying to work out where they would like to be and how they would get there. The seeds for the improvements were clearly sown at that meeting.

ORGANISATIONAL PERFORMANCE

On the whole, improved performance indicators are perhaps the most difficult to define, let alone measure. Several studies, such as those by Huselid (1995), Paterson et al. (1997), and Guest (1997), suggest that the most appropriate indicators of improved performance include low levels of absenteeism, productivity improvements and better staff retention rates. However, as previously noted, not all of the organisations maintained adequate absence, productivity or retention statistics that allowed independent assessment of the links between voice and performance. As a result we have to rely upon managerial impressions of the relationship between voice and performance, and it may be that superior organisational performance provides the space and resources to experiment with employee voice.

With these limitations in mind, several respondents expressed their belief that there was a clear link between voice and performance. The HR Manager at Scotchem felt that it would be impossible to gain significant improvements without a large element of voice. He was keen to achieve a situation where people wanted to do much more than just come to work and felt that such an environment directly contributed to low levels of absence and staff turnover. Interestingly, he suggested that a major advantage of voice was that ‘it greased the wheels of industry’. In that sense the link between voice and performance has a resonance with other ‘indirect’ benefits such as a more co-operative environment. The Manufacturing Director at
Scotchem also felt there were very clear, tangible benefits that had actually emerged from voice:

quite dramatic and remarkable improvements in quality and productivity, as well as in cost structures at the new plants ...I can see huge differences not just because of the technology, but in the way that people gain advantage from the benefits of the technology and apply it in order to improve performance.

While it was difficult to actually differentiate the impact of employee voice compared with any other aspect of employment relations at each of the organisations, all of the managers felt that, in their experience, voice was a major contributor to performance improvements. The potential for employee voice to contribute directly to additional business was mentioned several times, particularly at the smaller organisations where employees had some direct contact with customers. At Bet.com for instance, the speed and accuracy with which call centre operatives dealt with customers was viewed as critical for customer satisfaction, and it was argued that this helped to retain existing customers as well as gaining future business. Also, at ConsultancyCo, employee ideas were central to new client contracts and employees were encouraged to come up with new services and products on their own initiative. At Easymove Transport, drivers received a small bonus when they passed on information to the owner about customers and clients that might result in new business.

The major difficulty with evaluating such impacts is they tend to relate to other HR initiatives as well as voice. A number of organisations claimed that voice led to improvements in staff retention and a reduction in absence but this was often linked to a broader HR package rather than voice per se. At ConsultancyCo the central message was corporate culture. The centrality of ethics was a strong feature at Housing Association, while at Airflight and HiFi Sounds, customer care was regarded as of paramount importance. Overall, managers were confident that there was a positive relationship between employee voice and performance. However, what remains problematic is that much of the data is perceptual. That is, any voice
and performance link is predicated on the managerial assumption that ‘better performance is good for business’ and therefore must be ‘good for employees’.

CONCLUSION

In this study, the majority of definitions of voice provided by managers revolved around the processes rather than being explicitly concerned with outcomes. Few saw voice in terms of collective representation but instead tended to focus on two-way communications, an exchange of ideas or upward problem-solving. Some were adamant that it was the opportunity for voice that mattered and that not too much attention should be placed on the techniques that were in place. In this respect, voice was seen as an informal part of daily operations. If staff felt unable to express their voice, either through a lack of confidence or a belief that it would not be taken seriously, there was little point in having the systems in the first place. The overwhelming impression gained is that voice typically revolves around two-way communications. This is then seen as a way to enhance employee contributions and thus lead to improved levels of performance.

The evidence presented here suggests that the link between voice and performance remains problematic. A key issue is that of evaluation and on whose terms. Should assessments be made in terms of merely having a voice (i.e. the process) or in terms of how things may be changed due to voice (i.e. the outcomes)? If it is the latter, then who gains? None of the organisations in this study claimed that they evaluated the impact of voice initiatives as a whole, and in one way why should organisations be concerned with the impact of one practice on performance. Broadly speaking, employee voice operated primarily as a loose and imprecise notion that was seen to contribute to competitive advantage, but also as part of a general and broader package of HR practices. ‘Unpicking’ its contribution made little sense to these organisations.

Despite these cautions, there does appear to be a more systematic alliance of disparate voice
mechanisms than there was 10 years ago (Marchington et al. 1992; Marchington & Wilkinson, 2000). Two-way communications are now rather less about trivia and more about issues to do with operational outcomes. There is a longstanding academic view that effective worker participation in industry is doomed to fail because of the ‘arms-length adversarial’ system of industrial relations (Hyman 1995). From this perspective, neither workplace union representatives (focused on job controls and distributive bargaining) nor line managers (concerned to protect management prerogative) are interested in a positive-sum sharing of power that makes for effective employee participation. We found some evidence that this double blockage is becoming a less significant obstacle. In some cases the scope of collective bargaining (in both distributive and integrative terms) incorporated a broader set of strategic policies. A new generation of line managers, union representatives and employees appear more at ease with a set of inclusive (direct and indirect) rather than exclusive (direct versus indirect) voice practices. Managers seem more confident in organising direct exchanges of opinion with employees, while union representatives and employees expect them to do so. In this respect, there has been a normalisation of employee voice that transcends the traditional collective-individualist discourse.

While the UK and Republic of Ireland do not represent a single institutional industrial relations space, they are the only two European member states without a statutory framework for employee voice. This will change with the transposition of the EU Directive on Employee Information and Consultation promoting a more sympathetic, if qualified, support for trade union and representative forms of employee voice (Ackers et al. 2004). Moreover, the new citizenship rights agenda promoted by the EU pays particular attention to employee voice and impacts directly on employer choice in this area. Given the range of managerial initiatives assessed in this article, such as voice and partnership, the expectations of many employees have been raised. Indeed, many of the managers we spoke with stressed that employees are now more confident in expressing their views. As this enters the heart of working life and, in

the case of voice, gains institutional forms, organisations are increasingly likely to face a diffuse but persistent range of concerns from highly articulate employees. In this respect, managing employee voice will be closely related to managing diversity.

ACKNOWLEDGEMENTS

The authors would like to acknowledge the support of the Chartered Institute of Personnel and Development (CIPD) for the funding of this research, and in particular the assistance of Mike Emmott. The views expressed in this article are not necessarily those of the CIPD. An earlier version of the article was presented at the Association of Industrial Relations Academics of Australia and New Zealand (AIRAANZ) Annual Conference 2003, Melbourne.

Scottoil, like Scotchem, is part of a large multinational company which has a large degree of autonomy in how it manages employment relations.

Southern Shoe 11 500  Retail and manufacturing Personnel Manager The company employs about 3,500 in manufacturing and 8,000 in retail, mostly part-time. The company has been reorganised over the last decade with manufacturing sites closed in the UK and acquisitions made in Germany and Slovakia, along with satellite operations in Portugal and sub-contracting in India and Vietnam. There is high market competition for low cost production. The focus of this study is on manufacturing.

Weave Co. 2500  Carpet manufacturing Production Director Weave Co is a family-owned carpet manufacturer with a two hundred-year history. Following a bad spell in the early 1990s the company has now expanded its operations globally, with around 50% of the workforce UK-based. There is 80% trade union membership.

Whisky Co. 200  Distillers Head of HR Whisky Co operates across seven sites, with a growing share of the export (mainly US) market. With a merger and the restructuring process the TGWU was de-recognised with the GMB as the single union recognised. The company is keen on the creation of a new culture that incorporates employee voice.
