(Still) Up to no Good: Reconfiguring the boundaries of worker resistance and misbehaviour in an increasingly unorganised world

Abstract

The way industrial conflict and worker resistance have been analysed has undergone significant transformation over the past few decades. While researchers have observed the quantitative decline of traditional forms of employee resistance, others have highlighted the diversity and range of more informal employee behaviours. Following Peetz (2002) we show six distinct forms of worker resistance in response to three overlapping de-collectivising employer strategies. We locate the trajectory and significance of these employer strategies and subsequent forms of worker resistance to a neglected consideration of institutional and industrial context. The implications for the way worker resistance and misbehaviour is analysed and theorised in an increasingly non-union world are discussed. The paper indicates the need to consider the importance of institutional factors in reassessing potential delineations between what are considered formal (and often collective) indicators of conflict, and those more informal instances of workplace misbehaviour.

Key words: resistance; misbehaviour; institutional change; non-union

Introduction

Traditional models of organised labour have eroded under the process of western deindustrialisation. Similarly theoretical conceptions of worker resistance, focusing on individual workers and collective institutions defending prevailing interests, have become limiting analytical tools to explain the breadth of workplace behaviours. Within much of the extant literature, the tendency has been to assume that workers respond to managerial prerogative through formal collective or informal individual voice channels (Freeman & Medoff, 1984). Drawing on original longitudinal research among disorganised and poorly represented workers in both Australia and Britain, this paper analyses the shifting theorisation around resistance and misbehaviour over the last fifteen years. It highlights the importance of contextual factors that reconfigure traditional dichotomies between resistance and misbehaviour. As such the research suggests the need for a more inclusive institutionally-sensitive framework to capture dynamic variations of resistance and to help reconfigure what are often unhelpful binaries of misbehaviour and resistance.

Studies into the regulation of workplace relations traditionally focused on the institutions of job control, most importantly trade unions and collective bargaining (Zoller & Fairhurst, 2007). Conventions around pluralist industrial relations essentially saw the modification of workplace behaviour through collective bargaining and joint consultation as a process to institutionalise conflict (Flanders, 1965). In contrast, deeper sociological studies sought to illuminate the micro political systems underpinning workplace behaviour, including among other tactics worker sabotage, soldiering or go-slow to control and worker manipulation of the labour process (e.g. Roy, 1952; Buroway, 1979). Building on this tradition, Ackroyd and Thompson (1999) highlighted how employees temper and moderate the power and authority of employers by developing typologies that widened interpretations of workplace
(mis)behaviour. Recent analysis also sought to explain the use of alternative workplace forms of resistance amidst growing economic crisis and austerity measures faced by works in union and non-union settings, across public and private sector forms in different countries (Gall, 2011; Cullinane and Dundon, 2011). Sociological interpretations of work behaviours - such as incivility, sabotage, culture, humour, leadership or harassment - have helped to incorporate the social nature of much workplace conflict which emerges both vertically and horizontally (Roscigno et al. 2009; Grugulis et al., 2000; Collinson, 2005). For many workers who lack formal collective organisation, misbehaviours such as these (which are harder to identify and measure) may represent the most available forms of resistance and as such should be analysed as acts of resistance in their own right.

As indicated above, resistance research has widened through various lenses including cynicism, sexuality or gender, leadership, corporate symbolism or self-identity, among others (Fleming & Spicer, 2003; 2007; Willmott, 1993; Kärreman & Alvesson, 2009). However there has also been a significant tendency in some of the resistance research to downplay worker ‘interests’ (as opposed to identities) and to sideline how the labour process is played out (Thompson, 2005, 2011). These deficiencies are most apparent in the growing body of post-structural analysis into resistance and misbehaviour. For example Fleming (2005) portrays worker resistance at ‘Sunray’ through ‘culture programs’ and paternalistic management styles by noting that the ‘construction of identity’...(and the resulting cynicism)...was bound by context and societal discourses relating to class, capitalism, and patriarchy’. He continues, ‘the metaphor of production is appropriate here because it reveals how these resistant identities are realised when and where power is applied’ (ibid). However specific mechanisms of power or powerlessness are left unexplained and the context of class, capitalism, patriarchy or power as it relates to the production process and Sunray employees
remains under-developed and unqualified, other than noting its potential importance as a mediator. Ultimately employee responses outlined in this research (largely based around employee cynicism) were analysed within a structural and regulatory vacuum.

Utilising historical data from several worksites in Australia and Britain, this paper seeks to reinstate the importance of analysing managerial control and employee resistance within the political, institutional and economic context in which the labour process operates (Cullinane & Dundon, 2006). As such the important question is not so much ‘what kinds of resistance can not be incorporated’, as posed by Fleming and Spicer (2007: 3-4), but rather ‘what forms of resistance remain when workers are denied access to the formal structural mechanisms that mediate managerial power and authority?’ As such while identity factors should be considered, so should the enduring interests of workers and the institutional and labour facts that shape this interest.

In analysing these issues, we show that structural constraints and contexts are equally if not more important than the role of subjective and discursive identities. In the following section we provide a critique of contemporary discussions of managerial control and employee resistance. The research method is then explained, followed by a review of the form, scope and longevity of misbehaviour “as” resistance among respondents interviewed in different settings over fifteen years. The paper concludes with a discussion about the importance of analysing resistance and misbehaviour through a more nuanced rubric of institutional, contextual and structural change.
Changing contexts of managerial de-collectivisation and employee resistance

Peetz (2002) argues that liberal-market economies have seen the development of an array of increasingly sophisticated de-collectivising strategies aimed at consolidating managerial prerogative and excluding (in both symbolic and real terms) employee or union mobilisation. Peetz (2002) shows, however, that these strategies are not necessarily successful and he develops a model to understand the trajectories and patterns of change in response to managerial (as well as state/government) initiatives that promote a more individualistic rather than collective dimension to employment regulation. In contributing to this we extend the conceptual model by reviewing employee acts of resistance relative to three emergent de-collective strategies among a sample of non-union organisations in the liberal market regimes of Britain and Australia.

Much of the extant research into employee resistance and conflict management has traditionally focused on established institutions and formally recognised ways of mediating the broad interests of capital, labour and the state (Iremonger, Merritt, Osborne, 1973; Flanders, 1970). However these earlier preoccupations with ‘divergences in institutional development’, exemplified by Zeitlin (1987), downplayed important social and economic processes which shape industrial conflict and the institutions created to manage these behaviours (Teague and Roche, 2011). Over time these limitations led to invisible in/formal, power/control binaries (Mumby, 2005) which often missed important social factors shaping organisational resistance, including issues such as gender (Pollert, 1981), masculinity (Collinson, 1992, 2005), occupational community identity (Ashcraft, 2005; van Maanen & Barley, 1984) and sexual orientation (Burrell 1992), to name a few.
Given the earlier preoccupation with formal actions and the aforementioned omissions of the past, research into worker resistance incorporated more informal but ‘intentional actions ... which defy and violate organisational norms and expectations and core values, mores and standards of proper conduct (Vardi & Weitz, 2004). Recognising the need to incorporate ‘identity’ issues, Ackroyd and Thompson (1999: 2, 31) define resistance as ‘anything at work you are not supposed to do’. However as they, and others attest, establishing unifying terms for the various ways employees might react to managerial authority has not been straightforward (Vardi and Wiener 1996; Jermier, et al, 1994; Collinson & Ackroyd, 2005). Indeed, resistance and misbehaviour often overlap, as can individual acts of mischief coalesce into collective forms of resistance. Importantly, they may differ both in the nature of the behaviours as well as the perceived intent and outcomes of such actions (Ackroyd & Thompson, 1999:24). Mischief can be acts to ‘get back’ at management (or customers) or behaviours that allow workers to ‘get by’ when confronted with the degradation of a mundane job. These distinctions and definitional debates are what require further scrutiny in order to understand the nuances of informal and formal as well as individual and collective workplace (mis)behaviours (Thompson, 2011).

As part of the literature about mischief at the workplace came post structuralist suggestions that managerial control was omnipotent, and employee dissent futile (Zuboff 1988; Spitzmuller & Stanton, 2006). For example, Knights et al (1999:19-20) proposed that employees ‘willingly turned themselves into self-disciplined subjects who put in performances without management having to use up resources in distributing rewards and sanctions’. The rationale behind this self-discipline was attributed to a ‘loyalty to the brand and to the customer’ which ‘diminished the necessity for control sanctions and surveillance’. Alferoff and Knight’s (2000:2) research further argued that ‘call centre workplace
subjectivities meant that workers were embedded in organizational imagery, branding, service ideology and work...which ‘locked individuals into performance’(ibid:11). They suggest that commitment to deliver customer service leads to ‘resistance’ in the form of employees escaping into work by sidelining quantity objectives in favour of delivering improved quality service. In a similar vein occupationally prestigious workers, such as pilots, resisted by ‘overtly consenting’ to managerial directives (Ashcraft, 2005:69-83). While such post modern interpretations of worker behaviour indicate a reconciliation of competing objectives, they constitute a highly dubious example of resistance. One also wonders what alternative options might have been realistically available to these workers.

**All Quiet on the Institutional Front**

The dominance of post-structural discourse has underscored the tendency to ignore structural issues when analysing conflict by downplaying the regulatory, sectoral, occupational and institutional configurations that shape employment relations (Mulholland, 2004; Peetz, 2002). While the types of behaviours may have changed, the employment relationship and its attendant tensions remain the anchor against which much behaviour is mediated. Of course workplace tensions are far from homogeneous. Employers can seek to exclude unions as a matter of consolidating their prerogative (Gall, 2004), as a form of intimidation and anti-collectivism (Cooper et al., 2009), or as through policy discourse that seeks to engender employee engagement and commitment (Willmott, 1993; Peetz, 2002).

The variation of preferred managerial options for de-collectivism mean that workers in capitalist economies experience considerable volatility in market pressure which shape the institutional regime for voice and employment regulation (Kaine, 2011). Workplaces have
become increasingly more fragmented and the boundaries between employee and employer blurred though the use of flexible contracts, individualised management practices and outsourcing and de-layering (Grimshaw et al, 2004; Pas et al., 2011). Jobs are increasingly feminized and casualised, and workers experience less tenure, insecurity and work intensification. Trade union membership has declined significantly in most industrial countries and collective bargaining has either ceased to exist for many workers, or has been relegated to a form of managerial communication rather than negotiation. For example between 1970s and the turn of this century, firms that recognized trade unions dropped two-thirds to two-fifths (Standing, 2009:89). Union membership declined to an all time low of 27.4%; or 15.5% in the private sector (Barrett, 2009). Australian data shows union density to be just 19% of the economy. In the US union density is even lower at around 12% of the workforce (Australian Bureau Statistics, 2008; Dixon & Fiorito, 2009).

For a variety of reasons ‘growing numbers of people are either detaching themselves, or are being detached, from national regulatory and protective regimes (Standing, 2009:99). During the late 1970s and early 1980s, strikes and lockouts in the UK averaged around 1330 incidents, involving some 1.5 million workers that resulted in almost 12 million days lost. By 2008 such conflict declined to 144 incidents, involving 500,000 workers resulting 700,000 days lost (Economic and Labour Market Review, 2009). While precise cause and effect predications remain debatable, it is more than coincidental that the substantial decline of collective workplace organisation has occurred during periods of intensified political reconfigurations within nation States and market economies: Thatcherism in the UK, Regan in the US, and the Howard governments’ neo-liberal assault on trade unionism in Australia all bear the hallmarks of a public policy endorsement for non-union forms of work organisation (Cooper et al, 2009). Consequently, employer militancy buttressed by government policy has
recast the structural and contextual milieu within which employee resistance and misbehaviour emerges in neo-liberal economies (Cullinane and Dundon, 2011).

The corollary of union decline and escalation of anti-union managerial strategies for workplace resistance are more complex than measurable declines in strike and lockout activity (Gall, 2011). As Edwards (1995) has argued, the absence of organised strike action and union membership is not commensurate with industrial harmony or employee commitment or employee acquiescence or retreat. Union decline can in fact demonstrate a fear of management and an abuse of the managerial prerogative and is not simply a matter of employees choosing to opt out of union membership. Whist it may be that workers lack the power or inclination to collectively organise, it is evident that worker opposition manifests in a variety of ways. For example, the UK’s Unrepresented Worker Survey (URWS) of 501 low paid unorganized workers revealed how vulnerable workers may cope with problems at work. After pay, Pollert and Charlwood (2009: 350, 356) found that the most important issue non-union workers sought to resolve was that of work stress and bullying. However most importantly what their survey data revealed, is that 86% of workers who had a problem at work attempted to resolve the issue they reported, with 28% attempting to resolve it through collective means, group discussions or delegations to management. As such while young (un-unionised) workers may exit, they also resist in other ways including individual and collective challenges through group delegations to managers and group meetings. This and several other examples (Harisson, Laplante & St-Cyr, 2001; Dundon & Rollinson, 2004; van den Broek, 1997; McKinley & Taylor 1996) highlight the need to investigate the behaviours of (often more marginalised) non-unionised workers (Pollert & Charlwood, 2009:357).

1 In order of importance, issues ranged from pay, work stress or bullying, workload, job security, working hours, contract or job description, health and safety, opportunities, taking time off, discrimination (Pollert and Charlwood, 2009, 350).
The issue here is that resistance and misbehaviour take on very different meanings for workers who are denied formal structures of representation, or who feel such representation is futile. In short, against a changing industrial landscape and labour market configuration, the majority of workers who are unorganized have sought more subtle and innovative ways to challenge managerial power and authority. This goes to the heart of the questions we posed earlier and constitutes what follows below.

**Methodology**

This article draws on several qualitative research sources collected by the authors between 1994 and 2004. It is different from conventional monographs, in that it does not follow a prescribed set of objectives and research questions, from which interview schedules are then designed. Rather the project emerged from the authors’ recognition that each had been working on very similar research projects concerned with non-unionism, the changing nature of work in the absence of collective representation, and anti-union managerial strategies. In aggregate a data set existed that covers eight original case studies, with a total of 118 respondent interviews.² The original case research is supplemented by debates undertaken in existing published work into resistance and misbehaviour in both Australia and Britain (van den Broek, 2002; 2003; 2004; Dundon, 2002). Of course there are limitations to such an approach, not least the retrospective nature of reviewing interview transcripts for a paper not specifically or explicitly led by any overall objective.

² Further details are summarized in Tables 1 and 2 in the Appendix.
However there are some key advantages to such a research design, especially the international and longitudinal nature of the data collected over almost fifteen years. Furthermore, some of the deeper and richer sociological studies on workplace relations have a tendency to identify emergent themes post-research (Dundon and Ryan, 2010). Further scrutiny of the aims of our various research projects showed that the data offered considerable scope for integrating the evidence along several unifying and emergent themes that are important to contemporary labour process analysis. Significant amongst these was the experiences of non-union workers within different sectors of economic activity; among large, small and multi-national organisations; and the inclusion of evidence across a broad range of occupations and work skills. Many of the employees we interviewed encountered considerable contextual and structural change, including privatization, redundancy, outsourcing, managerial restructuring of work, and most particularly an increasingly more assertive managerial prerogative in resisting unionisation (van den Broek, 2008).

We therefore established criteria for an ex-post research design which allowed us to assess changes over time in a more holistic way than shorter or snapshot case reports, utilizing a staged approach to the re-analysis of data (see also Dundon and Ryan, 2010). The first stage involved reviewing the case organizations following Peetz’s (2002) model to establish a range of managerial de-collectivizing strategies. Three such strategies were observed i) ‘managerial anti-unionism’; ii) ‘inconsistent managerial objectives’, and iii) ‘strategies that reinforced the managerial prerogative’. These three exclusive de-collective managerial choices are identified in Table 1 in the appendix.
The next stage involved re-analyzing the data to classify distinct contextual and structural variation. In this regard specific contextual variables were found to be important across the case study organizations. These are given further methodological detail, together with the numbers of respondents in each case, in Table 2 in the appendix. The contextual diversity included assessing employee reactions to de-collectivism relative to market sector and economic pressures, work unit size/regime configuration, and occupational identity and solidarity. The third stage involved a re-analyzing the research transcripts to identify relevance of the above variables and assess connections to employee reports about resistance and misbehavior. In this way the staged ex-post research design enabled the formulation of a broad sensitizing framework that incorporated a number of important contextual and institutional dimensions, managerial strategies promoting de-collectivism, and finally analysis of employee acts of resistance (covert and overt) and misbehavior. Tables 1 and 2 in the appendix summarize these variables, methods and the respondents interviewed.

Findings

From the re-analysis of reported managerial strategies, the discussion below is structured around the nature of employee responses to the three managerial de-collective strategies of i) ‘overt anti-unionism’, ii) ‘inconsistent managerial objectives’ and iii) ‘reinforcing managerial prerogative’. Six subsequent employee acts of resistance and misbehaviour were then found. In aggregate terms, the data is summarised in Table 1 in the appendix. As the table indicates, some cells are blank. This can be explained because, as might be expected in a non-union and anti-union context, employees do not have the support systems to organise resistance as would otherwise be found in unionised environment. Likewise, as Peetz (2002) has already established, employer strategies and worker responses are not always mutually exclusive and in reality these overlap with one another. Employees may join union, for example, in response
to multiple and divergent managerial attempts to engender a de-collectivised strategy at the workplace level. It is for these reasons that while some employee responses may have once been interpreted as misbehaviour (say an act of mischief or defiance), these behaviours within such non-union employer settings can symbolise quite radical forms of resistance given the structural and anti-union threats posed by employers in the firms studied. Unsurprisingly, there are no reported strikes or mass workforce demonstrations in these organisations. Indeed this is the important point: given the absence of structurally-organised collective mobilisations, workers responded and developed tactics in various individualistic as well as semi-collective ways. As such the prevailing institutional and contextual milieu is an important mediator shaping worker resistance and misbehaviour to each of the managerial strategies analysed below.

i) Counterposing managerial anti-unionism

The response by workers to management’s (anti-union) action was symbolic of highly significant forms of resistance. Above all, worker actions and behaviours demonstrate that labour is an important agent capable and willing to resist managerial authority, despite the absence of formal systems of collective representation. In the TEC, for instance, a number of respondents explained they would distribute and circulate literature in support of a union recognition campaign. Importantly, workers had to engage in this action in covert ways given the anti-union stance adopted by management. Indeed, workers at the TEC also found management had been intercepting mail addressed to individuals thought to be “fraternising” with the union. More dramatic and public, at Mini Steel one employee (a former union steward at the plant) refused to relinquish his union membership when asked to do so by management. He was subsequently sacked for his continued allegiance to the union and defiance of management. Senior management explained that the compensation the individual

13
would obtain at an Employment Tribunal “was well worth it to remove a union activist” (the individual did successfully win at court for unfair dismissal owing to union activities).

Anti unionism was also endemic at Servo and Tellcorp (van den Broek, 2003; 2004). CSRs at Servo felt too ‘afraid’ to talk to unions directly if they sought access to the firm because of ‘the whole corporate monoculture’ where trade unions weren’t seen to have a place’. Similarly a major example of the union stance adopted at Tellcorp is reflected in an internal email from managers during a large downsizing operation in 2000. The memorandum advised team leaders that workers on individual non union contracts should be retained at the expense of workers on collective award and enterprise agreements. The memo from the Director of Employment Relations to team leaders advised that: ‘Staff members who have transferred to individual contracts have placed their trust in their managers and the Company to create a work environment that reinforces respect and dignity for the individual, and which places primary emphasis on productive relationships in which individual accountability encourages each person to contribute to his/her potential. Managers must not under any circumstances compromise these important values in the way they implement cost reduction initiatives which lead to staff reductions. (van den Broek, 2002; 2004) The apparent anti-unionism in this memorandum reflects the level of persuasion imposed on managers to reduce union influence in the firm.

While often hidden, illicit union involvement was an important form of resistance in anti-union firms. Five workers (two at Mini Steel; and one at ChemCo, DeliveryCo and WaterCo) volunteered the information that they were active union members. At Mini Steel this was due to the legacy of a formal collective agreement in which the union was recognised by management, and union membership may be expected in a situation following union de-

---

3 Interview CSR Servo 1996.
recognition. However, at Water Co union membership existed against an increasingly anti-union management ideology. The employee, a delivery driver, explained this was because he expected he would need protection at some point in the future. At DeliveryCo one call centre operative commented she was a union member as a matter of principle, while at ChemCo union membership related to the employee’s craft status and long history of unionisation for his occupation (Dundon, 2002).

Evidently, as indicated above, employee resistance and misbehaviour become all the more potent when it is understood how far organisations go in maintaining a non-union workplace regime and the apparent ease at which employers exercise their (ab)use of power. Thus the anti- and non-union actions of employers cannot be divorced from the responses of workers, many of which coalesce around a distinct collective identity which found ways to question and challenge management objectives. At times this identity also transcended into other, more distinct forms of overt collective resistance reported below.

ii) Counterpoising Inconsistent Managerial Objectives

Collective forms of resistance were not widespread, although where found they were organised to some extent, or at best consciously realised as a form of resistance. At Mini Steel workers, with the backing of the de-recognised trade union, challenged the employer’s anti-union behaviour with public campaigns targeted at the Personnel Director. He would be portrayed on fifteen-foot posters as the Tin Man from the Wizard of Oz (a man with no heart), or a macho manager characterised as Arnold Schwarzenegger in the role of the Terminator. Other tactics included advertising union meetings at a given venue but holding it somewhere else to avoid management observations. During one event a group of employees turned up for
their weekly groceries at the local supermarket in the early evening, only to exit at the rear and reconvene at another venue to hold a union meeting away from the watchful eye of management.  

Similarly against the strong anti-union sentiments expressed by Servo management, collective action was evident. For example, the issue of increased workloads and managerial pressure to reduce call-waiting times led to noticeable pockets of collective resistance. Call centre operatives at Servo bonded together and opposed the introduction of 'call forcing' (a system whereby calls are automatically dropped into employees headsets). CSRs presented their supervisor with a petition registering their opposition to the introduction of call forcing and their inability to deal effectively with customer inquiries. The petition indicated their belief that customer queues developed from under-staffing rather than from unsatisfactory employee performance. The petition stated:

as there has been no quality circle or our voices heard regarding this matter, we just thought that you should know what we think. The ... queue is 50 per cent outbound and 50 per cent inbound--the problem lies with the fact that we are understaffed, not the period of time it takes us to answer the phone.

4 It is perhaps not insignificant that since the research at Mini Steel in the mid 1990s, the company signed a union recognition agreement and the (offending) Personnel Director removed by the board of the company, a German-owned multinational.
The supervisor indicated that he would not respond to the petition, stating that if CSRs had any issues to be taken up, they would need to be pursued individually with management, rather than as a group.

Perhaps one of the less organised and more spontaneous forms of collective and direct resistance occurred at Water Co. Briefly, drivers at one of the sites were in charge of a company vehicle. Management decided that all employees could no longer use company vehicles outside of working time. Consequently, employees were required to make their own travel arrangements to and from work. Workers viewed this as the removal of a long established ‘perk’. Employees responded by all arriving for work late, claiming public transport disrupted travel times, especially for employees on shift patterns starting work at 6am. These responses were facilitated to a large degree by a close-knit working identity among those at the site. While some employees had their own transport, others did not, and reliance on public transport proved to be more disruptive for the company than it did for workers. One delivery driver explained:

> It wasn’t that we were deliberate, I mean we didn’t sit down and work out what we’d do ... I suppose we just knew that if we didn’t give one another a lift, Kenny would have to sort something out.

In short, there was no formal dispute, although workers did discuss the issue ‘in passing’ or during break times. Concerns were expressed by several individuals to the site manager. Importantly, what developed was an ‘understanding’ between workers (and possibly the

---

5 This was to lower insurance costs.
supervisor) that their own actions of ‘not’ giving one another a lift to work would be more disruptive to the company than it would to themselves. On a scale of collective action and resistance, habitually arriving for work late hardly constitutes the type of industrial conflict reported in government statistics or the traditional conflict literature. It could reasonably be described as a form of misbehaviour, even mischief. However, within the context of an increasingly anti-union and self-confident managerial prerogative articulated by Water Co management, coupled with the small social setting evident at Water Co, workers developed strong and solid bonds of identity and solidarity, despite the absence of a union conduit. In this instance, what can be viewed as misbehaviour is appropriately recognised as a highly significant form of resistance. Interestingly, after only a few days the ‘perk’ was soon restored by management at the company’s head office. Again in terms of intended outcomes, this is akin to similar acts of resistance.

At several of the case study firms workers across various occupational groups resorted to individual behaviours to circumvent and ameliorate management demands to manipulate work output. At TEC employees responsible for planning training events for staff at local business would consciously take longer than was necessary to do their work. Examples ranged from delaying a training event for days or weeks, to claiming that certain procedures, such as training audit of the staff involved had to be completed, when it was done several days before. At ChemCo some of the higher paid and higher skilled technicians explained they would often by-pass company procedures concerning quality. These employees spoke of management ‘making their jobs more difficult’. One technical engineer remarked:
I’d say most of us have to circumvent [quality operating procedures] because they just get in the way, especially if we’re working to time critical deadlines”

(technician, ChemCo)

Importantly, it was not just the higher-end occupations that had the capacity to control their work output as way of circumventing managerial authority. At MotorCo mechanics explained they would collude with warehouse staff so they could repair a component part (e.g. a starting motor) by saying there was none in stock. This took longer and occasionally turned out to be cheaper for the customer. It was also in direct conflict with managements’ policy of fitting replacement parts: a new part was a sale for the company and quicker to fit, which speeded up the mechanics job.

A further observed technique in this area was ‘foiling management surveillance’. For example, although not informed about when they were being monitored, call centre workers at Servo and Tellcorp reported how they learn to ‘recognise’ when monitoring takes place in their workplaces. These workers would also control the pace of their work by engaging in the regular practice of ‘flicking’. Here CSRs hang up on customers, redirect calls to other areas of the corporation or to other firms, or leave customers waiting for lengthy periods (van den Broek, 2008). Similarly, at Delivery Co couriers spoke of finding ‘their own space’ while under pressure to deliver parcels under very tight schedules. These workers were subject to technological surveillance in the vehicle, which provided management with a detailed breakdown of their routes, speed and whether they were ‘on target’ to deliver to client premises on time. Drivers would stop and claim they were held up in traffic as a way to obtain
a degree of control of their own work. Occasionally this was used to consciously deliver ‘late’ in response to managerial pressures. One courier driver at DeliveryCo explained:

You can’t get away from the NavManager … We all have a few places we know to grab a few minutes, usually just on the edge of a ring road or lay-by on a busy route …. There’s no way [manager] can tell if you’re stopped or in traffic

While such instances of ‘soldiering’ (that is going slow) have featured in some of the classic labour process studies (Roy, 1952; Buroway, 1979), the significance here is the continued endurance of such worker behaviours under very different workplace regimes. Indeed, activities to resist managerial authority and waste company time appear to be growing in contemporary workplaces. For example, the 2008 Time Wasting Survey (www.salary.com) of 2,500 US employees across all job levels show a 10 percent increase from the previous year’s study. Primary reasons reported were dissatisfaction with work and feeling underpaid for their work.

iii) Counterpoising Managerial Prerogative

At Water Co individual workers found it necessary to challenge supervisors in very direct and at times assertive ways, reflecting a particular macho or tough work regime in which language, banter and aggression were part and parcel of the labour process. In many ways employees recognised there was an abuse of the managerial prerogative and responded in various ways. On several occasions full-blown shouting matches were observed, usually concerning some allegation of favouritism between supervisors and other workers. It was often claimed by employees that certain drivers were given easier deliveries, with known
customer sites generally regarded as the more lucrative jobs because of multiple drops at one location helped boost bonuses. Other examples included employees ‘ignoring’ instructions to finish their coffee break and load vehicles. Indeed, despite threats of discipline from the supervisor, employees would hardly acknowledge they had just been told to carry out their work, even though they knew their break time was over.

By contrast call centre workplace regimes were neither macho nor tough, but rather tough love. Instructions were certainly ignored at times and threats were made, but this was usually done in less interactive, less overt and often less successful ways. For example during the negotiation of a new agreement in 1995, Servo staff were called to meetings. However when one CSR criticised shift worker allowances, she was ‘howled down’ by personnel staff and team leaders.\textsuperscript{6} Another stated that staff who voiced opposition were met with aggression, thus discouraging staff from volunteering feedback, rather deciding to put anonymous feedback in the suggestion box because they felt that ‘was the only appropriate way that we could do it’.\textsuperscript{7}

Another form of misbehaviour which, at times, translated to potential resistance emerged from actions that are often viewed as minor or less significant bouts of mischief. For example at Mini Steel personalized (and insulting) messages and slogans targeting the company’s HR Director meant workers found a sympathetic channel to articulate their dissatisfactions. In one episode of sabotage an employee known amongst co-workers as the ‘Scarlet Pimpernel’, would pepper the walls of the plant with graffiti describing the Personnel Director as Napoleon Bonaparte, amongst other insulting slogans (Dundon, 2002; Dundon & Rollinson, 2004). Respondents interviewed claimed not to know the identity of the individual. However

\textsuperscript{7} Interview Employee (OE10), 17.4.96.
this direct challenge to managements’ anti-union message represented a significant boost to employee morale.

**Summary and Conclusion**

Rather than analysing resistance and misbehaviour that ‘threatens and hurts nobody’ (Contu, 2007:14), or typologising resistance and misbehaviour as a self-embroiling post-structuralist tomb of (self imposed) gloom, this paper analysed employee resistance within its institutional and structural context, and against the emergence of a distinct de-collectivising managerial dynamic (e.g. Peetz, 2002). Our findings highlight the importance of institutional and context-specific factors which underscore the shifting boundaries between misbehaviour and resistance. Arguably, what is often portrayed as types of misbehaviour can in fact substitute for more assertive forms of resistance for those workers denied the opportunity for collective systems to channel their actions (see also Wilkinson et al, 2004). At both WaterCo and DeliveryCo, for example, workers found ways to circumvent directives through collective solidarity: at WaterCo workers consciously turned up late for work in response to unilateral managerial decision-making; at DeliveryCo drivers found ways to obtain time; at Servo employees presented petitions to management opposing work intensification and got-back at management by ‘flicking’ customers. These responses to managerial de-collectivism could also highlight a trend towards collaborative (rather than collective) bargaining based on occupational (rather than institutional) citizenship and solidarity (Wilkinson et al, 2007).

The evidence further shows that, given the majority of workers in capitalist market economies now lack formal collective representation, reliance on traditional (and often formalised and collective) indicators of resistance have become limiting analytical tools in depicting and
understanding workers acts of defiance and resistance. Arguably, therefore, to ensure the future identification of dynamic manifestations of resistance a more nuanced framework is required. The anchor of such a framework, we argue, is the changing structural contexts and variables within which the labour process takes place and within which managerial choices are played out. This is particularly relevant to employees in both large and small firms, union and non-union firms that deploy strategies to de-collectivise and dilute labour agency.

Although proxies of strikes and lockouts have utility, the problem remains that these only record one particular collective manifestation of resistance and they do not offer the explanatory power required to understand the complexity of worker (and managerial) behaviour. Of course assessing informal incidences of resistance and misbehaviour are difficult to both locate and quantify. Nonetheless, it is these forms of behaviours that are increasingly more critical in understanding how reward-effort relationships are recast in a variety of (trans)national industrial and occupational settings.

Amid new (technologically paced) forms of work organisation and so-called flatter and leaner workplace regimes, the boundaries between what is often perceived as misbehaviour on the one hand, and resistance on the other, have become blurred. Despite its increased confiscation into more discursive territories, the employment relationship remains central to understanding the nature of both resistance and misbehaviour. While Ackroyd and Thompson (1999) differentiate actions, they argue that misbehaviour should not be seen as a junior version or alternative to trade unionism or as a generic term which replaces, or leads to, resistance. It’s ‘just different’ and ‘it is there’ (1999, 164). Leading on from such differentiations, this paper contends that workers have been resisting managerial directives and ‘getting up to no good’ in
a multitude of ways. Misbehaviour is more than ‘just there’: it is conditioned, shaped and re-configured by the political, institutional and economic context in which the labour process operates. Indeed the contention here is that it is *specifically due* to wider institutional changes, such as the decline of traditional formalised institutions of industrial relations that we need to (re)consider individual and localised forms of agency within the wider political economy of western de-industrialisation and de-collectivisation.

Finally, employee and occupational identity have been important factors in shaping resistance. However, such identity makes more sense when it is understood within distinct contextual constraints. While there is a need to reclaim the indeterminacy of labour back from the indeterminacy of identity (Ackroyd & Thompson, 1999), there is also a more fundamental requirement to locate the indeterminacy of labour within specific occupational, institutional or structural contexts in which resistance and misbehaviour emerges, evolves and is played out at the point of production/service delivery. This would allow for a more nuanced understanding of the changing nature of employee resistance within the political and industrial (as well as its identity) context in which it emerges.
